

Release Notes

M-Business Anywhere®

Version 5.5

Server Builds: 128 (Windows), 142 (Linux), 141 (Solaris)

Client Build: 95

March 2004

1. Current build

1.1 - This document covers updates to M-Business Anywhere, Version 5.5, that the readme and other published documentation do not cover.

1.2 - This document describes:

M-Business Server Build 128 (for Microsoft® Windows®)

M-Business Server Build 142 (for Linux)

M-Business Server Build 141 (for Solaris™)

M-Business Client Build 95

2. Known issues

2.1 - If you are using Mobile Sales, Version 2.3, do not upgrade to M-Business Server, Version 5.5 without first contacting your sales representative or iAnywhere Solutions Professional Services.

2.2 - Do not install M-Business Server on a machine currently running an Adaptive Server Anywhere database. To help prevent this occurrence, the M-Business Server installer will quit if an existing Adaptive Server Anywhere database is detected.

2.3 - If you are using M-Business Server with NT Domain integration and are migrating your database during an upgrade to Version 5.5, after you install M-Business Server, Version 5.5, run `AGDomainSync -a -d` to ensure the database is completely repopulated. For more information on using the `AGDomainSync` tool, see the *Administrator Guide for M-Business Server*.

2.4 - After an upgrade to M-Business Server, Version 5.5, users will be prompted for their user name and password when accessing channels requiring authentication, even if they were previously authenticated.

2.5 - The new 400 error override feature only works when the page getting the 400 error is in the on-device cache and is not expired.

3. Support and documentation

3.1 - Contact Technical Support at corp_support@ianywhere.com.

3.2 - Download documentation for M-Business Server, Version 5.5 from http://www.ianywhere.com/downloads/software/mbus_windows.html (requires a valid user name and password) or from http://www.ianywhere.com/developer/product_manuals/mbusiness_anywhere/index.html.
