

## What's New in RFID Anywhere 3.5.1

This document contains release notes for the RFID Anywhere 3.5.1 release.

### Overview

This RFID Anywhere 3.5.1 release is a maintenance release that introduces German language support for the installation, tools, and administrator console.

New installations of RFID Anywhere should use this 3.5.1 release. If you have an existing installation, you should upgrade to this release to get access to the updated functionality and software fixes. All existing multiprotocol-related connectors, such as RFID reader connectors, must be upgraded to the latest versions. Existing custom business modules, simulation files and DPPs may need to be recompiled as well.

Prerequisites for RFID Anywhere 3.5.1 include version 2.0 of the Microsoft .NET Framework, Microsoft Installer 3.1, Microsoft's Web Services Extensions (WSE) 2.0 SP3, MSMQ, and IIS. The RFID Anywhere Visual Studio Extension also requires Microsoft's Guidance Automation Extensions.

### Summary of the installation process

The RFID Anywhere 3.5.1 release is distributed as a complete installation program for new users, and separate MSI files which must be deployed to an existing RFID Anywhere installation using the Provisioning page of the RFID Anywhere Administrator Console. Double-clicking these MSI files will not correctly install the updates.

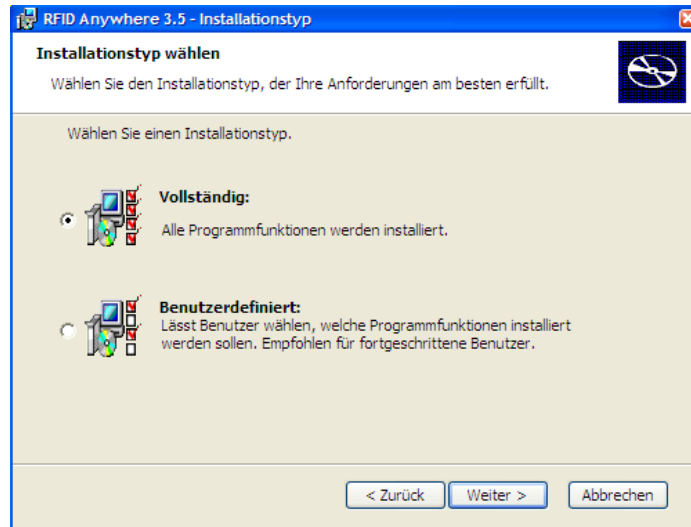

When upgrading from a previous version, install the core MSI package first, which updates the core RFID Anywhere functionality, using the Deploy Immediately section of the Provisioning page before installing the other MSI files and any required connectors.

See the RFID Anywhere Getting Started Guide or Tech Tips for detailed instructions on installing RFID Anywhere 3.5.1 on a clean machine, and for instructions on updating an existing installation using RFID Anywhere's provisioning capabilities.

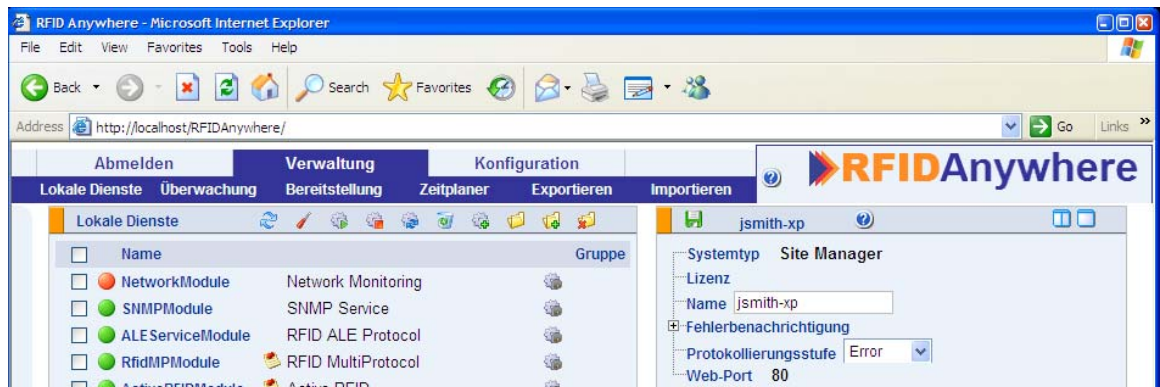

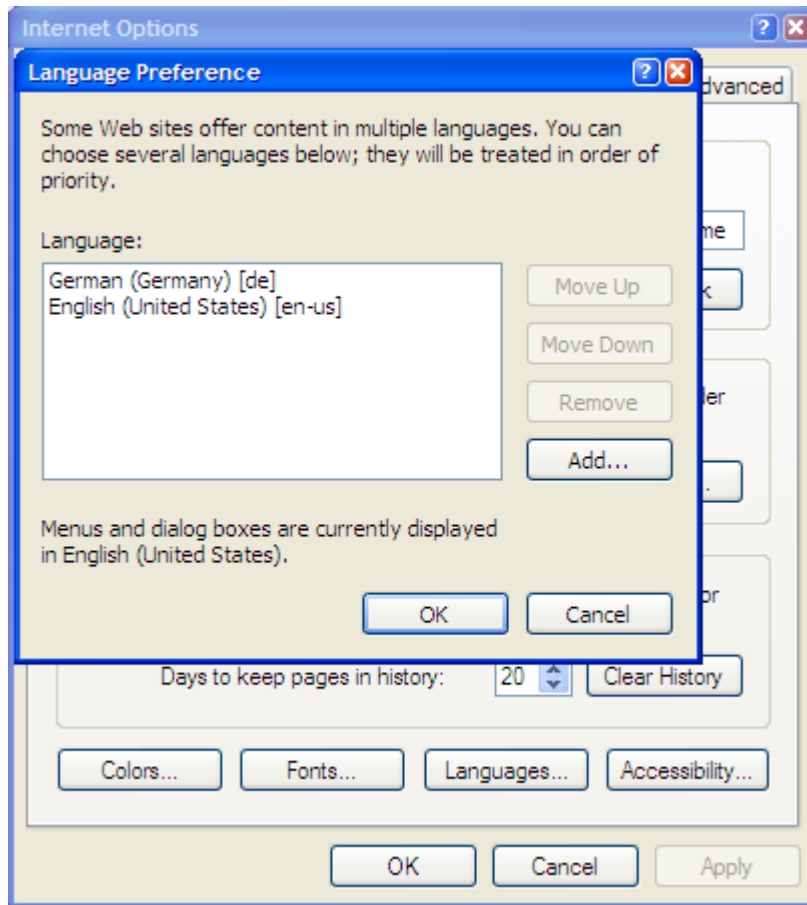

## What's new in this release

### German Language Support

When installing on a German version of Windows XP SP2 or Windows Server 2003, the RFID Anywhere installation program and the Enterprise Manager installation program will be displayed in German. In these cases, the RFID Simulator Data Editor will be presented in German as well.

Regardless of the language of the operating system of the RFID Anywhere server, users accessing the RFID Anywhere Administrator Console from a browser will be presented with a German interface if the language settings of the user's browser lists **German (Germany) [de]** before **English (United States) [en-us]**.

## Known issues

### Creating web references for standalone applications

When building a Visual Studio application to communicate with RFID Anywhere over web services, you must create the Web References in a Visual Studio .NET 2003 project and copy the generated .cs files to your application project. Visual Studio 2005 and 2008 do not natively support

integration with WSE 2.0 SP3 for Web Reference creation or WSE 2.0 enablement.

**Internet Explorer is recommended browser**

Internet Explorer is the recommended browser for accessing the RFID Anywhere Administrator Console.
